

# CL203: Database Systems lab

## Lab Task 11[Triggers]

**Submission:** Submit a log file, make sure you marked each query properly. [To create a log file run the command `tee path_file`]

Table 1: Users [user\_id (p.k)]

user_id	username	password	email
1	abc123	def321	<a href="mailto:abc123@yahoo.com">abc123@yahoo.com</a>
2	xyz789	vbn123	<a href="mailto:xyz789@gmail.com">xyz789@gmail.com</a>

Table 2: Summary [id(p.k)]

id	total_users	yahoo	hotmail	gmail
1	2	1	0	1

- Create a **stored procedure** to **insert data** into the **users table**. The values to be stored must be passed as parameters to the stored procedure.
- Create trigger(s) to update the records in the summary table. **The summary table will contain only one record** and will be updated each time a new entry is made to the users table, or an email address is updated in the users table or a user is deleted from the users table.

Insert data in the users table (at least 10 records) with different email addresses using the stored procedure created in (a).

Check the summary table each time you add a new user, update a user's email address or delete a user to check if the trigger(s) are working correctly.
